BACKGROUND

- Gastric cancer burden remains high in Japan, approximately 50,000 deaths/year in Japan (2nd leading cause of cancer deaths).
- ▶ Evidence supports a central role for *H. pylori* in the development of upper-gastrointestinal diseases, including peptic ulcer and noncardia gastric cancer.
- ▶ Studies have suggested that the prevalence of *H. pylori* infection increases with age, while the whole picture remains obscure.
- ▶ We systematically reviewed the existing literature that presented estimates of the prevalence of *H. pylori* infection in the Japanese population.
- ► The obejectives are:
- 1. to derive a robust prevalence estimate of *H. pylori* infection by birth year;
- 2. to clarify whether *H. pylori* infection exhibits a birth-cohort pattern.

DATA SOURCES AND SEARCH STRATEGY

- ▶ The PRISMA statement for preferred reporting of systematic reviews and meta-analyses was used as a guide to conduct this study. (Fig.1. Flowchart of Study Selection)
- ▶ **PubMed:** ("Helicobacter" [Mesh] OR "Helicobacter" pylori"[title/abstract]) AND ("Prevalence" [Mesh] OR "prevalence" [title/abstract] OR "infection rate") AND ("Japan" [Mesh] OR "Japan" [title/abstract] OR "Japanese" [title/abstract])
- ► EMBASE: ("prevalence"/exp OR prevalence:ab, ti OR "infection rate"/exp OR "infection rate": ab, ti) AND ("Japan"/exp OR "Japan: ab, ti" OR "Japanese: ab, ti") AND ("helicobacter"/exp OR "helicobacter pylori": ab, ti) AND (humans)/lim.
- ▶ We also scrutinised the reference lists, and searched for unpublished data by contacting the head of ongoing projects.
- ► The risk-of-bias assessment was independently performed by two authors (Y.L. and C.W.) using the Joanna Briggs Institute Prevalence Critical Appraisal Tool^a.

Figure 1: PRISMA Flowchart of Study Selection

STATISTICAL ANALYSIS (1)

- ▶ More details on how to estimate prevalence of *H. pylori* by birth year can be found **here**^a.
- ▶ Prevalence by birth year were extracted from 47 studies (300 data points).
- Penalized cubic spline was used to model the prevalence as a function of birth year in the framework of generalized additive mixed model (GAMM) implemented in the mgcv package in R. ^ahttps://winterwang.github.io/For_Inoue_pylori/

STATISTICAL ANALYSIS (2)

- Pre-specified explanatory variables included in the meta-regression were as follows: Study ID, birth year, population source (community-based or clinical-based), diagnostic testing (serological test, or others; others: urinary assays, salivary assays, stool antigen tests, and gastric biopsy), types of ELISA kits for measuring *H. pylori* positivity (antigen derived from domestic or foreign strains), and data collection period (prior to the year 2000, or later than 2000), with study ID as a random effect and other variables as
- Observations weighted by the inverse of the sum of the within-study variance and the residual between-study variance using the meta package.

RESULTS

fixed effects.

- Details/characteristics of the studies included in the current meta-regression analysis are available online^a
- ▶ Summary of the results of risk of bias diagnosis is available here ahttp://rpubs.com/winterwang/288338

CONCLUSION

- ▶ Prevalence of *H. pylori* infection exhibits **a birth cohort effect** in Japan, with prevalence decreasing steadily in individuals born in successive years, from 55.6% in 1950 to 12.8% in 1990.
- ▶ Given the fact that the birth-cohort pattern of *H. pylori* shapes the trends of gastric cancer over time, our findings help to inform screening efforts aimed at prevention and early detection of gastric cancer in Japan.
